## Audi 01J Product Information

From 2003 Audi introduced the new "Multitronic" CVT transmission to its range, known as the 01J. The primary feature of this unit is an integral control module eliminating the need for separate transmission ECU. Drive is via damper plate rather than a torque converter using controlled forward clutch before ratio change begins. As always at JPAT we are working constantly to provide our customers with the parts support for this all new transmission including updated modifications such as the all new 7 plate forward clutch package. Call today for details.

## Chrysler 45RFE Accumulator Plate.

From 1999 onwards Daimler Chrysler introduced a new 5 speed automatic transmission to its range of 4x4 vehicles including hugely popular Jeep Grand Cherokee. This transmission, 45RFE (Reardrive Full Electronic) replaces the

outgoing 46RE (A518) and features 3 planet sets providing 5 forward ratios, unusually only using 4 ratios on the upshift and a fifth ratio on downshift. This provides a smoother ratio change during kickdown. This transmission has suffered with problems with the bolts that retain the accumulator plate to the valve block working loose, bending the plate and losing accumulator pressure.

At JPAT we now stock a re-designed accumulator plate and cap screws which also features additional fixings to prevent future failure. A must for any rebuild.
